

PROMPTING HELPER · A DESKTOP STUDIO FOR AI IMAGE MAKING

From a character to a finished picture.

Characters you keep, prompts written in each model's own language, renders you compare, repair and keep: all in one place, on top of ComfyUI.

- **Build a character once** and cast them into any scene.
- **One prompt, every model:** Illustrious, Anima, Krea 2, FLUX, Qwen and more, each in its own dialect.
- **Render where you like:** your own ComfyUI, its API, or Comfy Cloud.
- **Decide, then improve:** compare checkpoints and seeds, tune the winner, repair and upscale it.
- **Windows · macOS · Linux.** Your library stays on your own disk.

THE IDEA

One workspace, one walk from idea to keeper

Most of AI image making happens between the tools: copying prompts, retyping a character, guessing which checkpoint did what. Prompting Helper keeps the whole walk in one app, and every step hands its result to the next.

01
Characters
who is in the picture

02
Prompt Builder
what happens, written for your model

03
Lineup
decide: checkpoint, LoRA, seed

04
Tuning
improve: Draft, Quality, Final

05
Canvas & Enlarge
repair, upscale

06
Gallery
keep, post

BUILT ON COMFYUI

Your graphs, driven by the app

Bring any ComfyUI workflow and bind its inputs to the app, or start from ready-made pipelines. Render on your own GPU, through ComfyUI's API, or on Comfy Cloud. Wavespeed, Venice, Magnific and Topaz are built in too.

AI WHERE IT HELPS

Reads pictures, writes prompts

A vision model reads a picture into a prompt, finds the people in it, writes scenes and trims a prompt to its token budget. Use your own key: OpenAI, Claude, Gemini, Grok, GLM, OpenRouter, or a local Ollama. Everything else works without one.

YOURS

On your disk, not in a cloud

Characters, prompts, pictures and settings live as files on your own computer. Export a bundle, back it up, move it to another machine.

01 · CHARACTERS

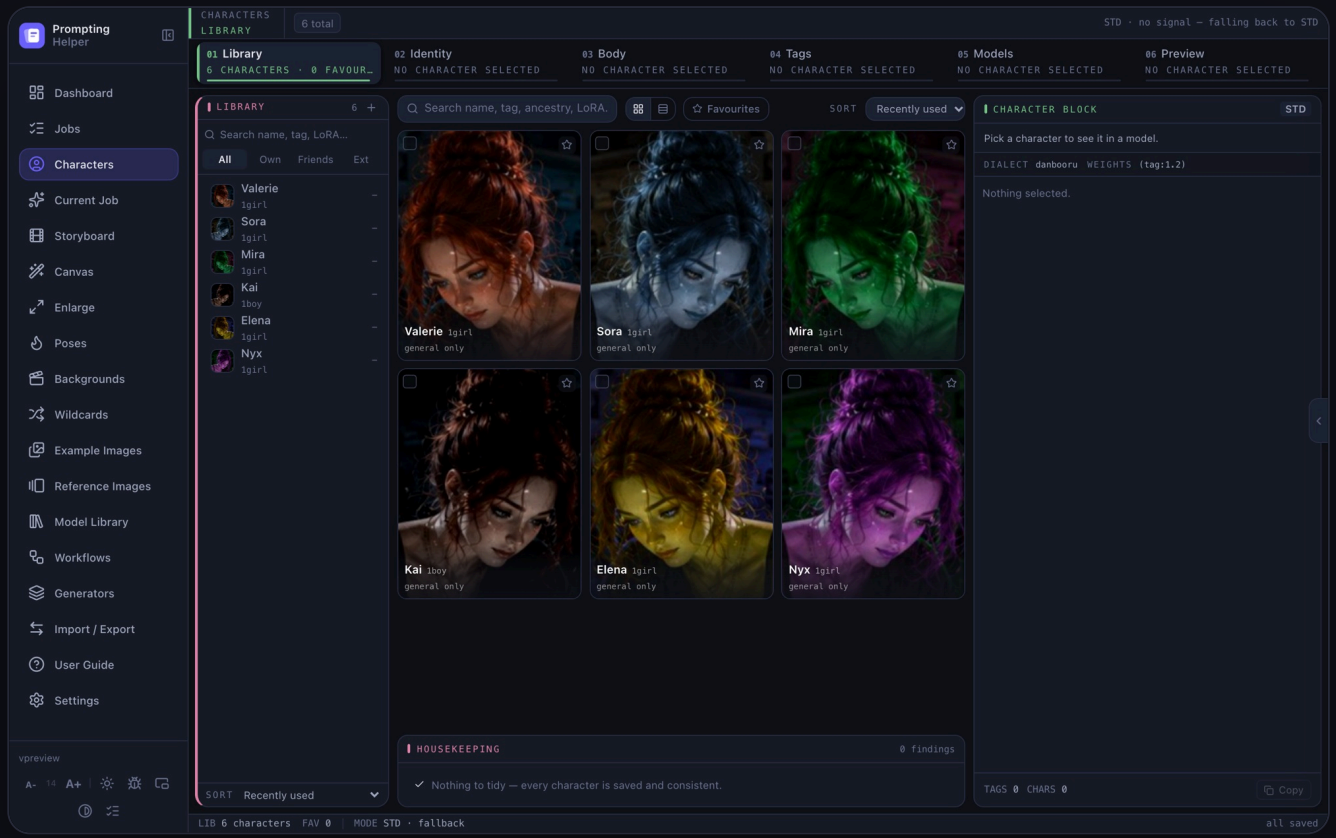

Build a character once. Cast them anywhere.

A character is a complete description you keep: identity, body, face, hair, outfit by region, their own LoRAs. Drop them into any scene, alone or with others.

Detailed, not a tag soup
Face geometry, body, anatomy and outfit sit on their own axes, each holding as many tags as it needs.

Essentials that survive every cut
Mark what makes a character recognisable. Shortened prompts and token budgets keep it.

See them in any model
The character block shows how the character reads in the dialect of the model you render with.

The character library. Demo portraits.

02 · PROMPT BUILDER

The prompt, assembled for the model you render with

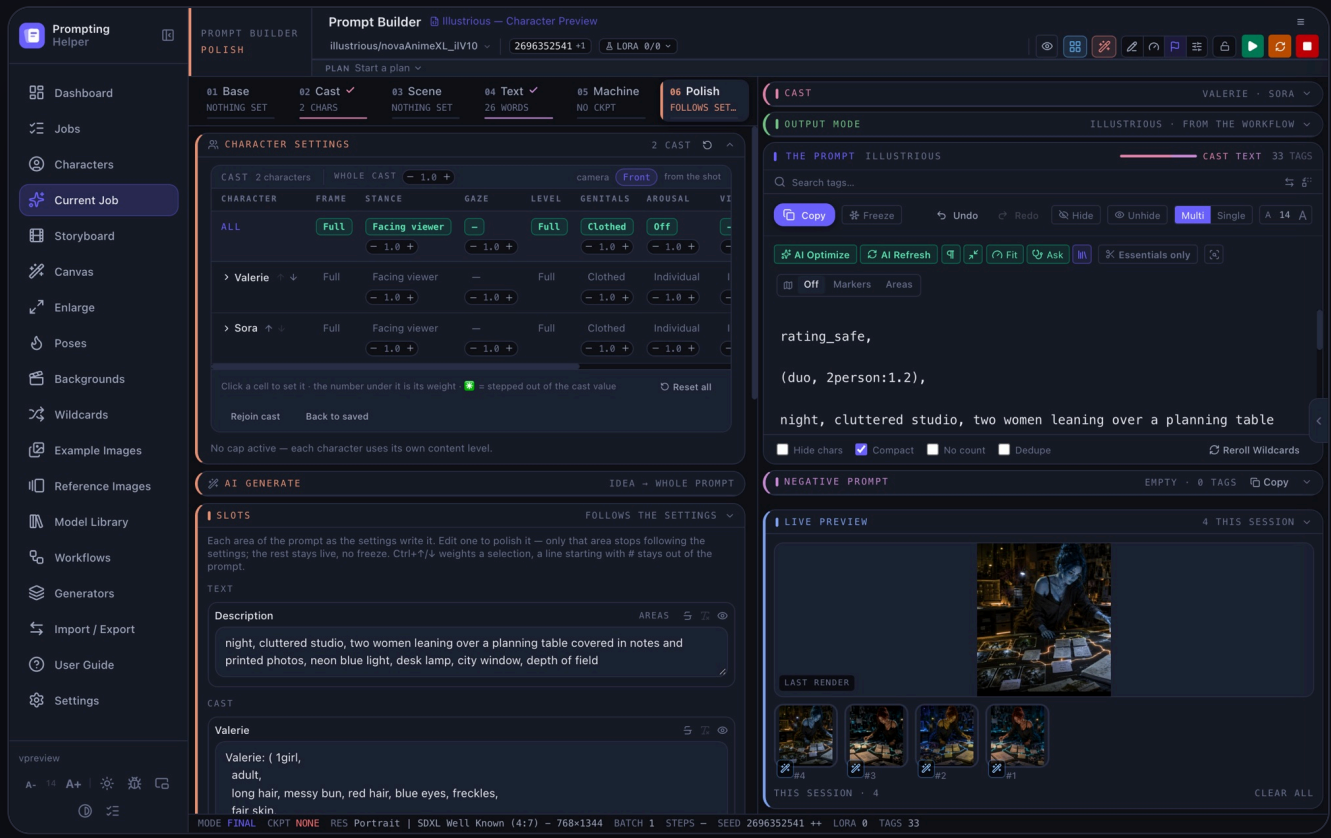

Six stages from base to polish, with the finished prompt always on screen. The same cast and scene are written as tags for Illustrious, as sentences for Krea 2, as prose for Anima.

The cast in one table
Framing, stance, gaze, arousal and their weights per figure, or for everyone at once.

Draft · Quality · Final
One switch picks how far the render goes; Ctrl+Enter renders whatever stands there.

Live preview and session strip
Watch the picture form, step back through this session's renders.

Illustrious · NoobAI · Pony · Anima · Krea 2 · FLUX · Qwen · Z Image · WAN · GPT Image

Polish: the cast table, the prompt as it is sent, and the previews of this session.

03 · EXAMPLE IMAGES

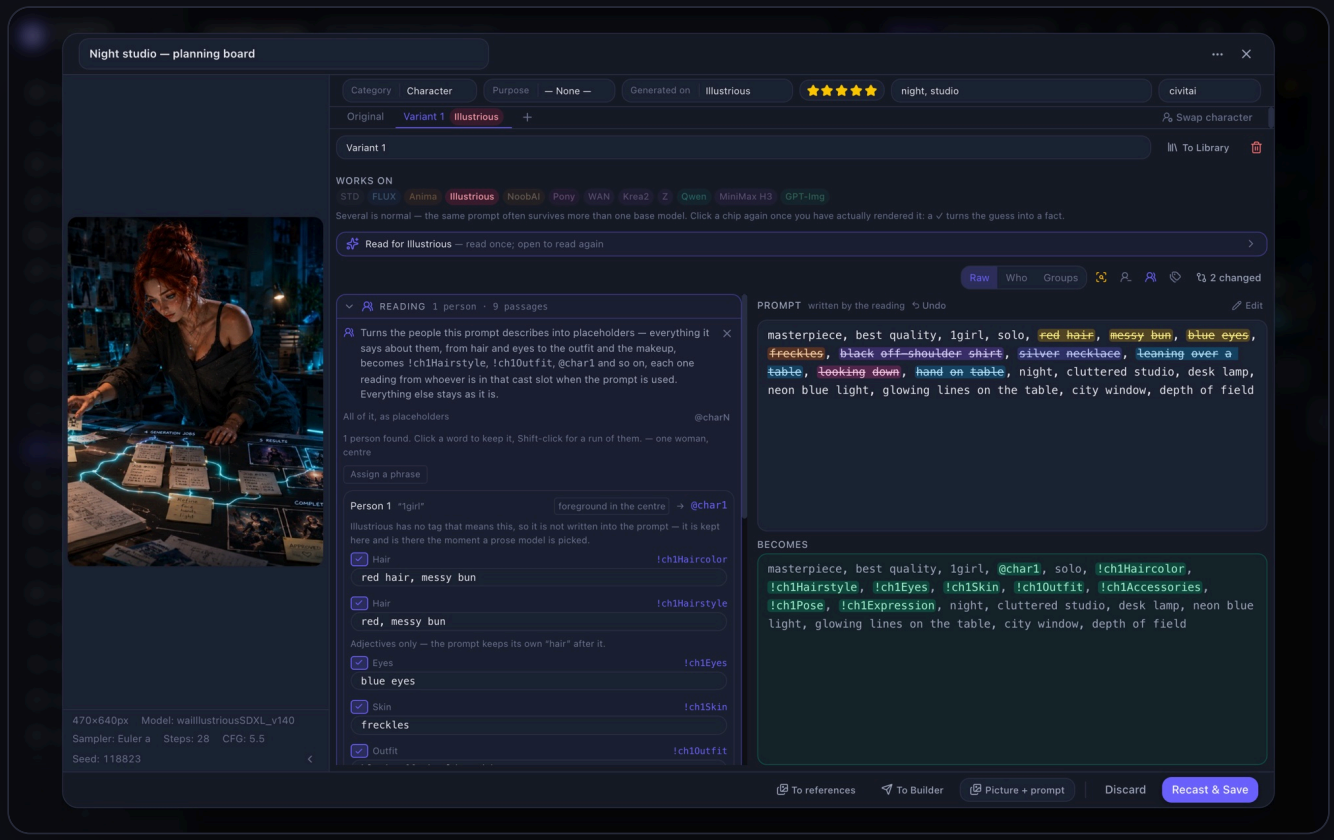

Borrow the scene. Bring your own cast.

Keep the pictures you love with their prompts. Then take what you came for, the pose, the light, the room, and leave the borrowed person behind.

The AI reads the picture
Picture and prompt in one call, rewritten for your model. It adds what the picture shows and never drops what only the prompt knew.

People become placeholders
Recast turns the person into `@char1` and `!ch1Outfit` lines. In the Builder your character fills them.

Scene only
Read just the scene: pose, outfit, framing and light, with no borrowed look anywhere.

A reading laid out as a recast: what becomes a placeholder, and the template it becomes.

04 · WORKFLOWS

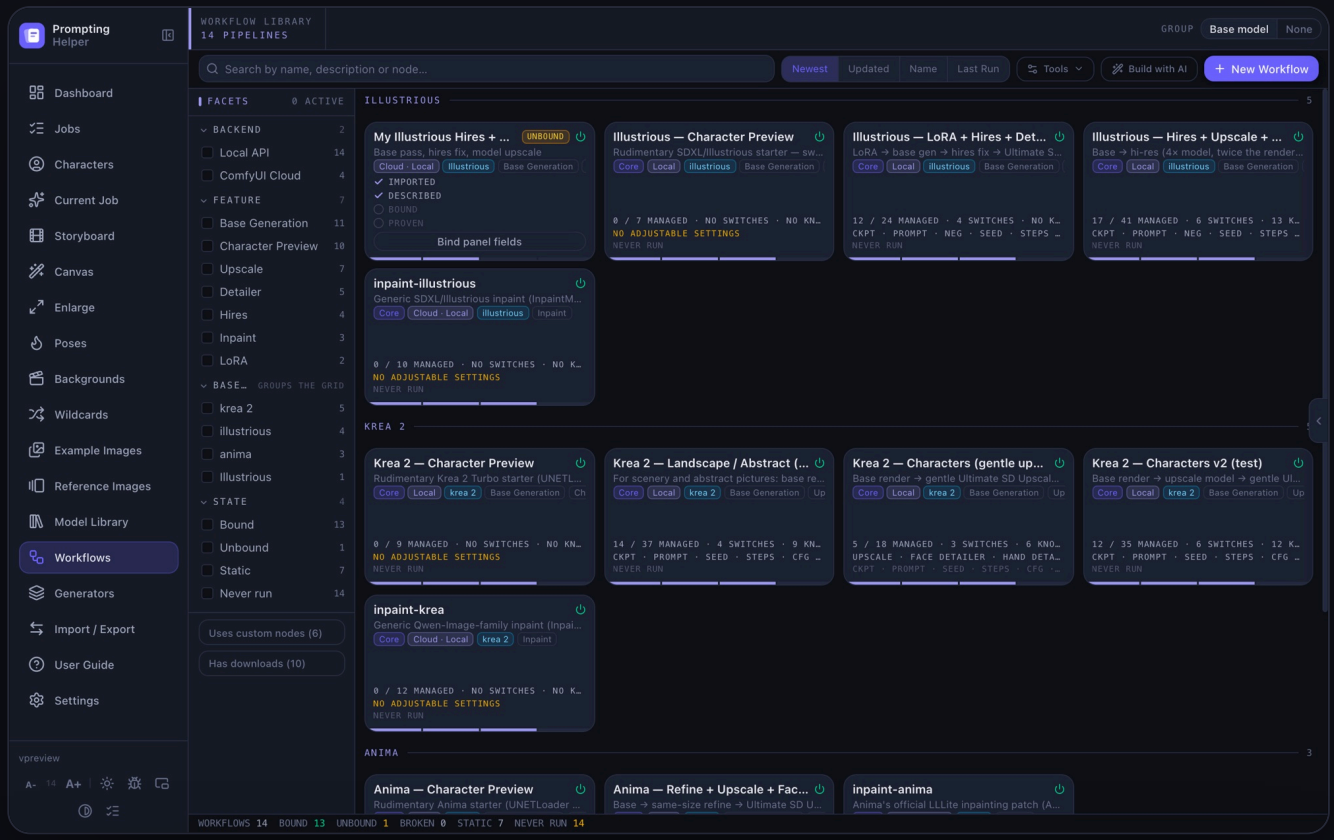

Your ComfyUI graphs, ready to drive

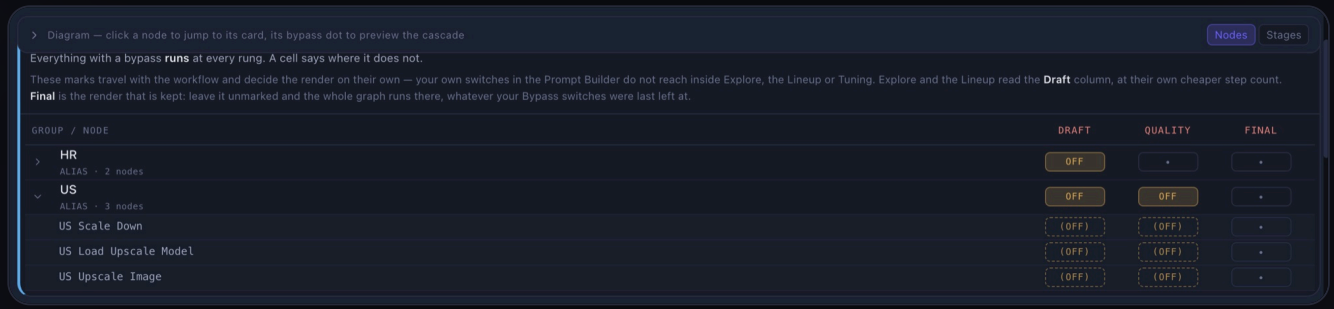

Paste or load a workflow; the app finds its prompt, checkpoint, seed and sampler, and turns the settings you care about into panel fields.

Pipelines that come set up
Illustrious, Anima and Krea 2 pipelines ship ready: base, hires, upscale, face and hand detailers, SeedVR2 clean-up.

What runs at each rung
The Modes matrix says which stages run at Draft, Quality and Final, so a cheap look stays cheap.

Presets per workflow
"Landscape, more detail": named value sets that travel with the workflow.

05 · LINEUP & TUNING

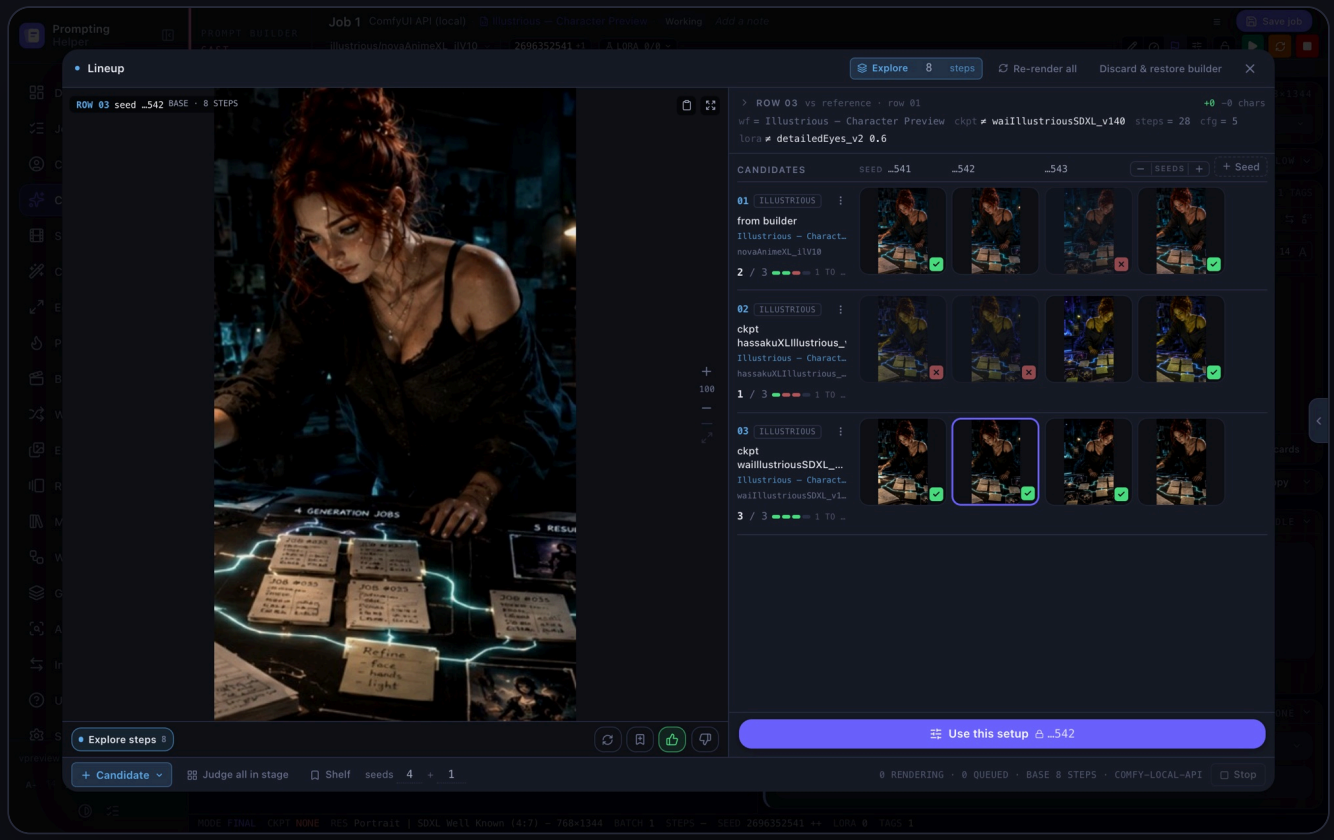

Decide first. Then improve.

The Lineup puts candidates side by side: rows are setups, columns are seeds, every cell is a quick render. Vote, compare against a reference row, keep the winner.

Cheap where it should be
Lineup cells render at a capped step count; how cheap is yours to set, per base model.

Use this setup
The winning cell moves into Tuning with its seed locked: wording, Draft, Quality, Final.

A shelf for ideas
Snapshots keep a setup, its prompt and the picture, to finish another day.

Three checkpoints, four seeds, votes on each cell.

06 · MODEL LIBRARY

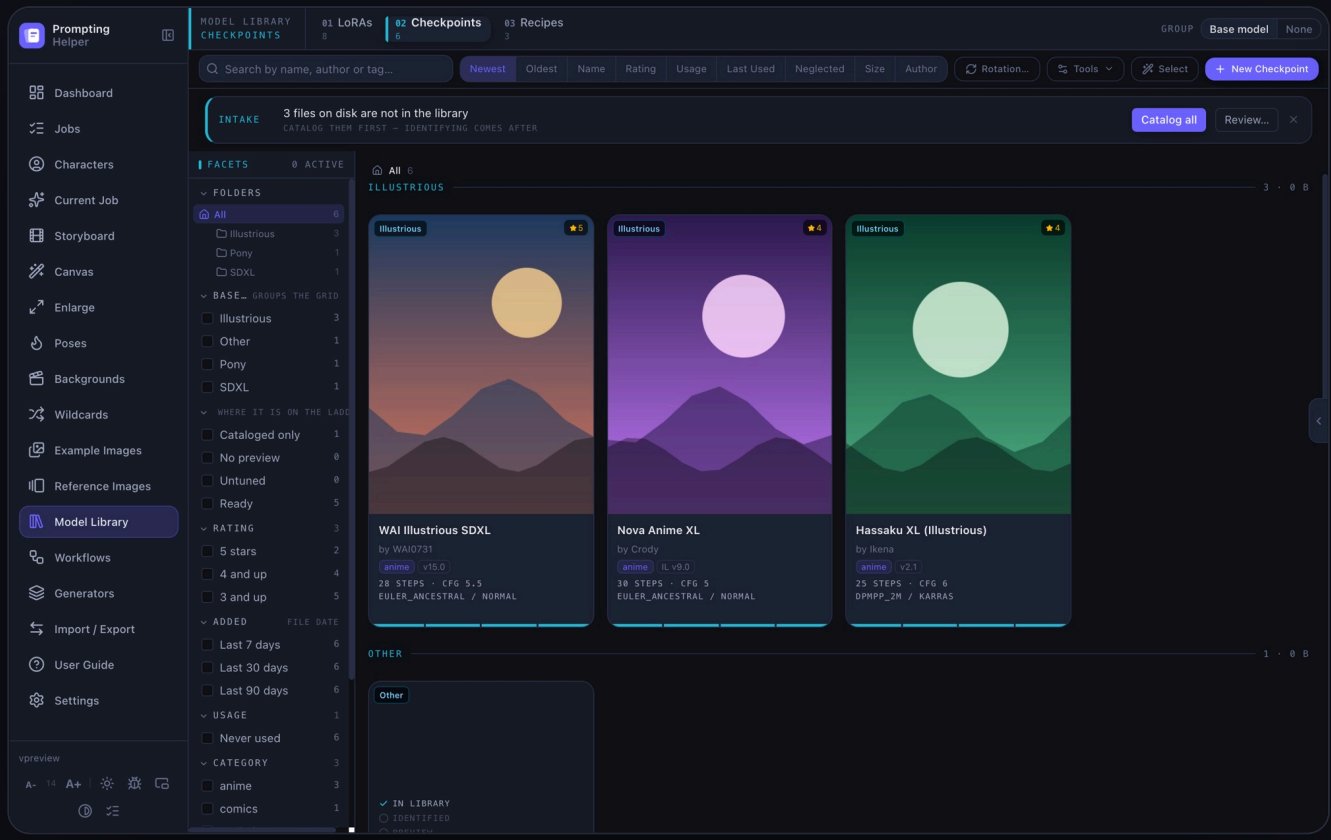

Every checkpoint and LoRA, with what it likes

Your models with previews, ratings and usage, grouped by base model. Each checkpoint carries its sweet spot, steps, CFG and sampler, so every render starts right.

Intake
Files on disk that are not in the library yet are found and catalogued.

Recipes
LoRA combinations saved as one click, and armed for the session.

Facets
Folder, base model, rating, usage, category: find the one you meant.

Checkpoints grouped by base model, with their sweet spots.

07 · FINISHING

Repair it, upscale it, keep it

A good render is rarely finished. The tools for the last ten percent sit in the same app, and the result goes back where the render came from.

CANVAS

A picture editor for AI work

Layers, selections, fills and grades, plus inpaint repair on your own GPU or in the cloud. A repaired picture replaces the render it was made from.

TOPAZ

Every run kept for comparing

Upscale from the Canvas with any Topaz model. Each run stays beside the others, so you can see which one brought what.

ENLARGE

Six engines, faithful to inventive

Plain resize, Real-ESRGAN on your machine, your own ComfyUI upscale workflow, Topaz and Magnific, sorted by how much they invent.

IMG2IMG

Start from a picture

Reference pictures with framing and zoom, and "Free this area": full strength where you paint, a gentle share everywhere else.

REGIONAL PROMPTING

Who stands where

Place each character in a region of the frame, from a grid or a reference picture.

INPAINT WORKFLOWS

Ready to use

Inpaint pipelines for Illustrious, Anima and Krea 2 ship tagged and enabled. Pick a checkpoint from your library and repair.

Stories, a remote on your screen, and your phone

STORYBOARD

From a story to a cut video

Story bible, scenes, prompts per scene, batch renders to approve, video clips, and a timeline that cuts and mixes the final video with bundled ffmpeg. Song planning and card decks too.

FLOATING HUD

A small window that stays on top

The last render, the seed, Render, Re-render and Stop while another app is in front. An RP mode for a session of its own, and a POST mode that writes the social post.

PHONE

The Builder on your phone

The whole Prompt Builder in your phone's browser, on your home network: open a job, change it, render through the desktop, repair and keep the picture.

GALLERY & JOBS

Every render is a job you can return to

Results, settings and the prompt that made them. Flag the keepers; the rest can go.

CROSSPOST HELPER

From render to post

Works with the sibling app over a local bridge: shared reference library, keeper flags that skip its triage, posts written for the picture.

GENERATORS & LIBRARIES

Ideas on tap

Procedural and Gacha generators, wildcards, pose and background presets, booster combos and 59 style blocks that reach every model.

GET STARTED

What you need

Runs on	Windows, macOS and Linux.
Rendering	ComfyUI on your own computer (an NVIDIA card with 8 GB or more, or a Mac with Apple Silicon, is recommended), or Comfy Cloud. No extra ComfyUI plugins are needed to start.
AI features	Optional. Bring your own key for OpenAI, Claude, Gemini, Grok, GLM or OpenRouter, or run Ollama locally.
Your data	Stays on your disk. Export bundles and backups whenever you like.

Where to go next

Download the latest release from `github.com/valerie-4659/promptinghelper-app/releases` or `valerie-4659.itch.io/sd-prompt-manager`. The user guide (`PromptingHelperGuide.pdf`) walks through each part, one chapter each:

`Getting Started` `Prompt Builder` `Characters` `Model Library` `Workflows` `Example Images` `Regions, References & Masks` `AI Analysis` `Lineup & Tuning` `Canvas` `Storyboard` `Backup & Moving`
